12-bit, serial IN, parallel OUT driver
BU2090 / BU2090F / BU2090FS / BU2092 / BU2092F / BU2092FV

The BU2090, BU2090F, BU2090FS, BU2092, BU2092F, and BU2092FV are 12-bit serial input, parallel output drivers.
For the BU2090 / F / FS, data input is shifted to the 12-bit internal shift register on the rising edge of a clock pulse. On the falling edge of the pulse, if the DATA pin is HIGH, the data in the shift register is output in parallel to Q0 to Q11.
For the BU2092 / F / FV, shift data read at the rising edge of CLOCK is output in parallel to Q0 to Q11 at the rising edge of LCK. These ICs also have an OE pin, which when HIGH, forces data to be output, regardless of the shift data state.

●Applications
Radio cassette players, telephones, compact audio systems, car stereos, and others

●Features
1) Low power dissipation.
2) Operating voltages ranging from 2.7 to 5.5V.
3) Output is Nch open drain.
4) High output withstand voltage of + 25V.
5) Diverse variety of packages.
   BU2090 / F / FS: DIP16, SOP16, SSOP-A16
   BU2092 / F / FV: DIP18, SOP18, SSOP-A18
   (plastic molds)
6) High drive capability; direct lighting of green LED possible.

●Absolute maximum ratings (Ta = 25°C)
(BU2090 / F / FS, BU2092 / F / FV)

Parameter		Symbol	Limits	Unit
Power supply voltage		V_{DD}	– 0.3 ~ + 7.0	V
Power dissipation	BU2090 / F / FS	Pd	1000 (DIP), 300 (SOP), 500 (SSOP)*1	mW
	BU2092 / F / FV		1050 (DIP), 450 (SOP), 400 (SSOP)*1	
Power dissipation	BU2090 / F / FS	Pd	500 (SOP)*2, 650 (SSOP)*3	mW
	BU2092 / F / FV		500 (SOP)*2, 650 (SSOP)*4	
Operating temperature		Topr	– 25 ~ + 75	°C
Storage temperature		Tstg	– 55 ~ + 125	°C
Input voltage		V_{IN}	V_{SS} – 0.3 ~ V_{DD} + 0.3	V
Output voltage		V_O	V_{SS} ~ 25.0	V

*1 Unmounted
*2 When mounted on a glass epoxy board of 50mm × 50mm × 1.6mm
*3 When mounted on a glass epoxy board of 90mm × 50mm × 1.6mm
*4 When mounted on a glass epoxy board of 70mm × 70mm × 1.6mm

BU2092 / F / FV switching characteristics measurement conditions

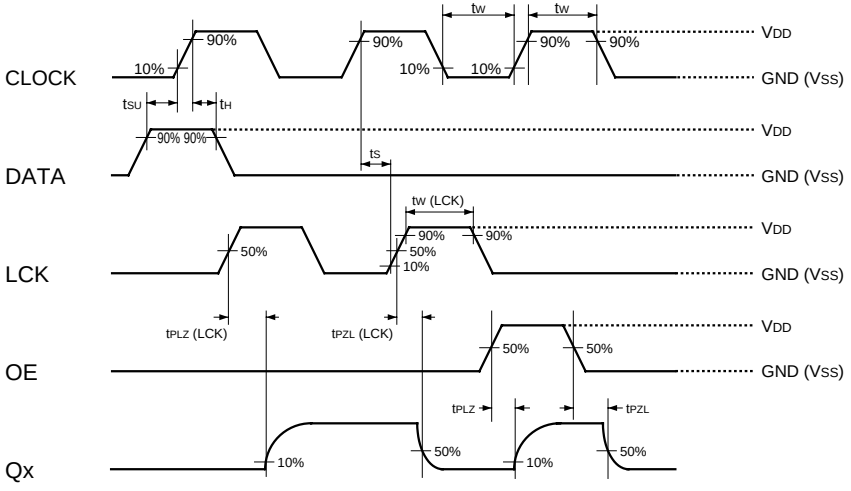

Fig.2

●Truth table

BU2092 / F / FV

INPUT				FUNCTION
CLOCK	DATA	LCK	OE	
×	×	×	H	Output (Q0 to Q11) disabled
×	×	×	L	Output (Q0 to Q11) enabled
↑	L	×	×	First cell of the shift register stores the LOW. Other cells, respectively, store data from the preceding cells or other prior data. (Output state is HOLD.)
↑	H	×	×	First cell of the shift register stores the HIGH. Other cells, respectively, store data from the preceding cells or other prior data. (Storage state and output state are HOLD.)
↓	×	×	×	No change in shift register.
×	×	↑	×	Contents of shift register are stored in storage register.
×	×	↓	×	No change in shift register.

Q0 to Q11 output for the BU2090 / F / FS and BU2092 / F / FV is Nch open drain output. When the shift register transfer data is LOW, the corresponding output FET is ON (continuous state). When the transfer data is HIGH, the output FET is OFF (discontinuous).

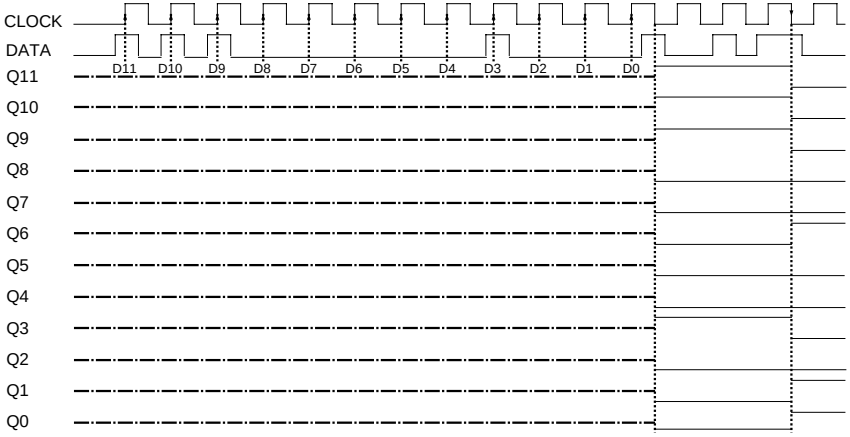
●Circuit operation

The logic of the DATA pin is sent to the 12-bit shift register on the rising edge of the CLOCK pulse. Subsequently, it is shifted from Q0 to Q11 for every clock rising edge.

For the BU2090 / F / FS

When the DATA pin is LOW on the CLOCK falling edge, the data does not change its output state. It is only shifted in the internal shift register. However, when the DATA pin is HIGH, the content of the 12-bit shift register is latched and is output to the corresponding Q0 to Q11.



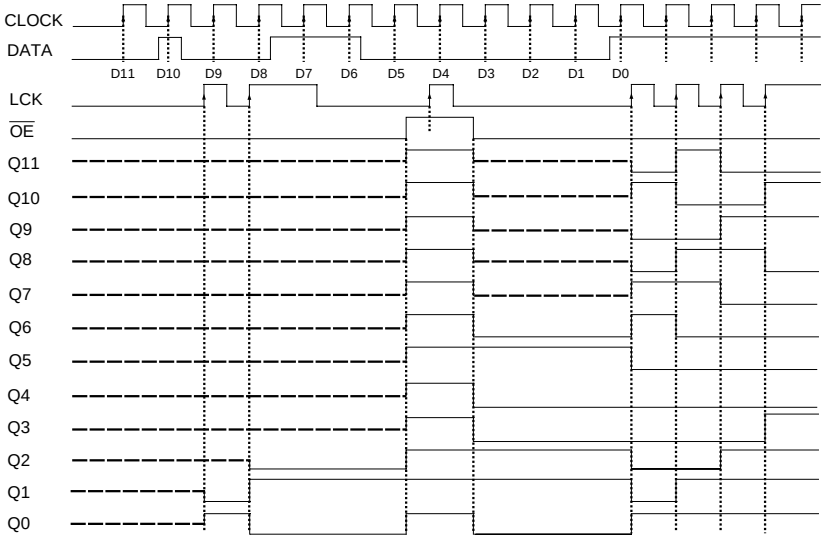
Note 1) ─·─·─ indicates unstable output.

Note 2) Pull-up resistance is connected to the output pin.

Fig.3 Operation timing chart

For the BU2092 / F / FV

The content of the 12-bit shift register is stored in the 12-bit storage register at the rising edge of LCK, and is output to the corresponding Q0 to Q11. When OE is HIGH, regardless of the content of the storage register, the output FET turns OFF and enters a HIGH (discontinuous) state.



Note 1) —·—·· indicates unstable output.

Note 2) Pull-up resistance is connected to the output pin.
